

Environmental Claims Software

Environmental damages are going unclaimed every day. We provide the software to collect these damage claims.

We at, Claimer.org, have developed a software package to facilitate the compilation of environmental damage claims so that those damaged receive the compensation that they deserve. These damage claims, when collected and litigated, will not only benefit the victims of environmental damages but also provide companies an economic incentive not to create environmental damages.

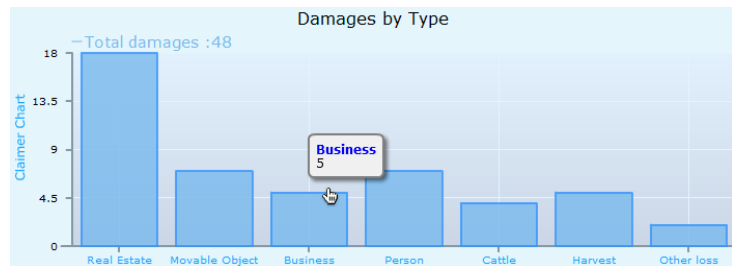

The software can be integrated with you current website and color scheme. The software was originally designed for the collection of climate damage claims but can be used for the collection of any environmental damage. See <http://demo.claimer.org/> as an example of the system.

Visitors to the website can add their damage claims through the web interface, or an internal team can add these claims. With the claimer.org software a list of claims and victims can be compiled and maintained.

Environmental Claims Software

The backend of the system provides powerful management of the data. Backend users can see various information and data as needed.

The backend features:

- Easy to use web interface
- Quick overviews of the information
- Search against multiple criteria
- Customizable and printable views
- Permissions and access control for users
- Send emails to contacts or groups
